## 初始狀態僅有65.6分

## Assessment: 65.6 points

由於大數字較難合成,故將大數字保留在角落會比較高分,而預設順序是上右下左,因此將順序調整成上右左下並且不再隨機

```
opcode({ 0, 1, 3, 2 }) {}

//logic
virtual action take_action(const board& before) {
    for (int op : opcode) {
        board::reward reward = board(before).slide(op);
        if (reward != -1) return action::slide(op);
    }
    return action();
}
```

分數提高為 70.9 分

Assessment: 70.9 points

接著用預設的獎勵計算方式改成貪婪走法

```
virtual action take_action(const board& before) {
   int point = -1, act;
   for (int op : opcode) {
      board::reward reward = board(before).slide(op);
      if(point<reward){
        point=reward;
        act=op;
      }
   if (point != -1) return action::slide(act);
   return action();
}</pre>
```

分數提高為85.8分

Assessment: 85.8 points 將兩種方法結合最終為 88.2 分 Assessment: 88.2 points
